EDITOR'S MESSAGE

Digital Dental Cameras is expected to grow at a rate of more than 11% through the year 2023. The dentistry industry is growing at a steady and fast pace as technological tools and information are in demand for the practical spectrum of digital harnessing. As of today, this computer-aided image capturing is deemed a small part of what is meant by "digital dentistry".

Susan Tricia
Editor

Digital dentistry refers to the use of digital technology in the practice of dentistry. Examples are digital X-rays, 3D imaging, and computer-aided design and manufacturing (CAD/CAM) to create dental restorations. Digital dentistry will probably continue to be integrated into dental practices to improve effectiveness and accuracy, together with the patient experience of dental treatment.

Dental Tribune ASEAN will be circulated in dental exhibitions, seminars, and even webinars across ASEAN providing additional mileage for advertisers of the magazine and reaching out to new subscribers. Visit our website at asean.dental-tribune.com for more updates.

We have APEX for this issue where we interviewed Ivan Choe, the director of Digital Dental APEX talking about their background and mission, and their forte and focus on the dental industry. Ivan also shared with us the challenges that APEX faced in the adoption of 3D printing and also his views on digital dentistry in Malaysia.

Study offers new insight into diversity and prevalence of bacteria in oral infections

By Iveta Ramonaite, Dental Tribune International

Mounting evidence suggests that oral infections can affect the course and pathogenesis of systemic diseases and are an emerging challenge for healthcare, which is why it is crucial to detect and monitor severe oral infections and oral bacteria. Since only few longitudinal studies have identified which bacteria occur in infected oral and maxillofacial regions, in a recent study, researchers from Karolinska Institutet in Sweden identified the bacteria typically found in severe oral infections and determined emerging oral microbiota trends. They hope that the findings can provide more insight into the link between oral bacteria and other diseases.

In their study, the researchers from Karolinska Institutet examined samples from patients with severe oral infections, mainly dental abscesses and jaw osteomyelitis. They collected these samples between 2010 and 2020 at Karolinska University Hospital and produced a list of the most common bacteria. The study included a total of 1,014 samples, which were analysed using a mass-spectrometric method called MALDI-TOF that helps to quickly identify individual living bacteria.

A total of 102 bacteria species were reported during the entire study period, with a range of one to seven species per sample.

Prof. Margaret Sällberg Chen. (Image: Stefan Zimmerman)

commented. “The finding isn’t only of importance to dental medicine, it also helps us understand the role of dental infection in patients with underlying diseases. If a certain bacterium infects and causes damage in the mouth, it’s very likely that it can be harmful to tissues elsewhere in the body as the infection spreads,” she added.

Since the study was a single-centre epidemiological study, larger studies are needed to ensure the validity of the results. “We now hope that dentists will collaborate with clinical microbiology laboratories more to gain a better understanding of the bacteria that cause dental infections, to improve diagnostics and therapeutic management of oral infections,” said Dr Volkan Özenci, adjunct professor of clinical bacteriology in the Department of Laboratory Medicine at the institute.

The study, titled “Clinical microbial identification of severe oral infections by MALDI-TOF mass spectrometry in Stockholm County: An 11-year (2010 to 2020) epidemiological investigation”, was published online on 24 November 2022 in *Microbiology Spectrum*, ahead of inclusion in an issue.

“We’re reporting here, for the first time, the microbial composition of bacterial infections from samples collected over a ten-year period in Stockholm County,” Prof. Margaret Sällberg Chen from the Department of Dental Medicine at Karolinska Institutet said in a press release. “The results show that several bacterial infections with link to systemic diseases are constantly present and some have even increased over the past decade in Stockholm.”

The researchers found that the most common bacterial phyla among the samples were *Firmicutes* (51%), *Bacteroidetes* (19%), *Proteobacteria* (12%) and *Actinobacteria* (5%). Additionally, the most common genera were *Streptococcus* spp. (36%), *Prevotella* spp. (18%) and *Staphylococcus* spp. (11%). Finally, the researchers also noted a significant trend in the increase of some bacteria, for example *Streptococcus anginosus* and *Eikenella corrodens*, during the duration of the study. The levels of other bacteria increased minimally or remained unchanged.

“Our results provide new insight into the diversity and prevalence of harmful microbes in oral infections,” Prof. Chen

Removable partial dentures may improve mortality among partially edentulous adults

By Iveta Ramonaite, Dental Tribune International

New research has highlighted the effectiveness of removable partial dentures in improving the long-term survival rates of patients. However, further research is needed to validate the findings. (Image: Sergii Kuchugurnyi/Shutterstock)

In a recent study, researchers have examined whether the use of removable partial dentures has an impact on the long-term survival outcomes of partially edentulous adults. They reported that using removable partial dentures may indeed have long-term benefits in reducing mortality among adults with a non-functional dentition but cautioned that further research is needed to validate the findings.

The researchers used data from the Third National Health and Nutrition Examination Survey conducted by the National Center for Health Statistics, a division of the US Centers for Disease Control and Prevention, and linked it to publicly viewable mortality files for the period up to 2019. For the purpose of the study, they included as participants 1,246 partially edentulous adults with fewer than 20 teeth whose use of removable partial dentures and dentition status had been determined by clinical examination.

The findings showed that removable partial denture wearers experienced a 26% increase in survival time. Additionally, the researchers observed that for every 7.5 individuals treated with removable partial dentures, one death would be prevented after ten years of treatment.

Discussing the motivation behind the study, lead author Dr Nasir Zeeshan Bashir, a researcher at the University of Leeds in the UK, told Dental Tribune International: “Although I am a dentist, I also retrained in mathematics and statistics and am very interested in any research where I can utilise my statistical inference skills. I think dentistry has a real lack of research on long-term outcomes, so being able to assess the long-term effect of dentures while using robust statistical methodology was ideal. My colleague Dr Eduardo Bernabé is an epidemiologist who has done previous research in this field, and this research question followed up well on his previous work.”

Commenting on the findings, he added: “Rehabilitation of patients with non-functional dentition could have a substantial impact on these patients, beyond just restoring their dentition.” When asked how exactly removable partial dentures could improve mortality among partially edentulous adults, Dr Bashir explained that the study did not specifically assess why dentures have this effect. However, he noted that a few hypotheses were put forward in the discussion section of the study.

“Firstly, eating a well-balanced diet is difficult when you are lacking many teeth, as fibrous foods like vegetables can be tough to chew. By restoring the dentition, it has been shown that masticatory efficiency increases and, therefore, it may be that these patients with dentures have an improved diet. Secondly, it could be that those patients who wear and use their dentures regularly are well motivated in other aspects of their general health. They might also be more self-confident and lead a less sedentary lifestyle,” he commented.

Although the findings are promising, Dr Bashir cautioned that the results should first be validated in a randomised trial in order to ratify the conclusions about the effectiveness of removable partial dentures.

The study, titled “Removable partial dentures and mortality among partially edentulous adults”, was published online in the November 2022 issue of the *Journal of Dentistry*.

Two of the most acute problems experienced by major dental companies during the third quarter were shrinking consumer confidence and foreign exchange headwinds owing to a strengthening of the US dollar. (Image: Pop Paul-Catalin/Shutterstock)

Dentistry scrapes through thirdquarter check-up

By Jeremy Booth, Dental Tribune International

The cascading effects of Russia's invasion of Ukraine have hobbled global pandemic recovery. Third-quarter reports from the largest dental companies show that patients are thinking twice about some elective treatments and that clinicians are investing less in dental equipment. A strong performance by the Straumann Group helped dentistry through its third-quarter review, however, and milestones such as 14 million Invisalign patients and 90 years at Henry Schein remind us that it is a marathon, not a sprint.

Global player Straumann led the industry in the third quarter with sales of CHF 550.5 million (€560.8 million), representing overall organic revenue growth of 12.2%. Sales

increased by 7.0% (15.1% organic sales growth) in its home region of Europe, the Middle East and Africa (EMEA), by 14.2% (9.1%) in North America and by 8.4% (8.6%) in the Asia Pacific region. The company performed the strongest in Latin America, where sales increased by 25.9%, or by 20.9% on an organic basis.

Sales in Germany were the largest contributor to Straumann's performance in EMEA, and those in Australia, Taiwan and Japan offset a growth slowdown in China and shored up earnings in the Asia Pacific region. In Latin America, powerhouse Brazil provided Straumann with robust demand, followed by Mexico, Columbia and Peru.
