Restoring endodontically treated teeth

AirLight Series

The Next Standard NO Fiber Optic System, but you will get a LED powered handpiece

The truly innovative design of this handplece incorporates Direct LED Light powered by its own miniature built in generator. This cutting edge technology allows the operator to have a clear illuminated operative field without the fiber optic systems. The drive air rotates the miniature generator. The electricity generated illuminates the LED that is optimally positioned on the face of the handplece, providing daylight bright illumination. It is so efficient there is no loss of air pressure or torque, and the three coolant water ports provide the desired coolant spray pattern.

Built-in Generator: Generates electricity No fiber optic system required from your dental delivery unit. Fits 4, 5 and 6 hole tubing

Direct-LED

the LED Light is optimally positioned on the face of the handpiece to provide larger light pattern than the traditional power optic systems

Ceramic Ball Bearing

Ceramic bearings are 25% harder than conventional stainless steel bearings,but just half the weight. Lower friction results in quieter and heatless operation, especially at high speed, and longer turbine life.

Beyes LED technologies Colour temperature: 5,500K Light intensity: at least 25,000 lux. BEYES LED delivers natural daylight quality light and assures clearer vision,which halps to reduce fatigue during operation.

Welcome to*roots*

Torsten Oemus, Publisher Dental Tribune International

The amount of new information available in the dental field about new products, techniques and research data is astounding. Running a practice and seeing patients leaves little time for catching up on the latest clinical news and product information. Thus, we hope *roots* will not only be a welcome respite for those rare chunks of time you can devote to leisurely reading, but one that provides a practical return on your investment by providing information that you can actually put to immediate use.

For the first issue of the U.S. edition of *roots*, we've assembled a collection of articles from some of the most respected names in endodontics. These expert clinicians are sharing their knowledge and expertise with you.

Within this issue, you can read a report from Dr. Nadim Z. Baba and Dr. Charles J. Goodacre about key principles that enhance success when restoring endodontically treated teeth; case studies by Dr. Konstantinos Kalogeropoulos on retreatment of a lower molar and by Dr. Rafaël Michiels on treating a calcified mandibular molar; plus thoughtful analysis by Dr. L. Stephen Buchanan on new additions to the armamentarium and by Dr. Ken Serota on the question of endodontics vs. implants.

But there's more. Every issue of *roots* magazine also contains a C.E. component. So, by reading the article on predictable apical microsurgery by Dr. John J. Stropko, then taking a short online quiz about that article at *www.DTStudyClub.com*, you will gain one ADA CERP-certified C.E. credit. Keep in mind that because *roots* is a quarterly magazine, you can actually chisel four C.E. credits per year out of your already busy life without any lost revenue or time away from your practice.

To learn more about how you can take advantage of this C.E. opportunity, visit *www.DTStudyClub.com*. Annual subscribers to the magazine (\$50) need only register at the Dental Tribune Study Club website to access these C.E. materials free of charge. Non-subscribers may take the C.E. quiz after registering on the DT Study Club website and paying a nominal fee.

I know that taking time away from your practice to pursue C.E. credits is costly in terms of lost revenue and time, and that is another reason *roots* is such a valuable publication.

I hope you enjoy this first issue and that you get the most out of it that you can.

Sincerely,

Torsten Oemus Publisher

ANNUAL DENTAL TRIBUNE STUDY CLUB SYMPOSIA AT THE GNYDM

1.0

For the fourth year in a row, Dental Tribune Study Club hosts its annual C.E. Symposia at the GNYDM, offering four days of focused lectures in various areas of dentistry. Find us on the exhibition floor in aisle 6000!

Each day will feature a variety of presentations on topics, which will be led by experts in that field. Participants will earn CE credits for each lecture they attend. DTSC is the official online education partner of GNYDM.

PLEASE SEE PROGRAM DETAILS UNDER WWW.DTSTUDYCLUB.COM/GNYDM

REGISTER NOW: WWW.GNYDM.COM

ATTENDEES MUST PRE-REGISTER AS GNYDM VISITORS FOR FREE.

SUNDAY, NOVEMBER 27

10:00 - 11:00 DR. HOWARD GLAZER // COURSE NO. 3780 GIOMERS: NEW GIANTS OF MI DENTISTRY

11:15 - 12:15 DR. SHAMSHUDIN KHERANI // COURSE NO. 3790 COMPREHENSIVE DENTISTRY USING DIGITAL IMPRESSION TECHNOLOGY

12:45 - 1:45 DR. RON KAMINER // COURSE NO. 3800 MINIMALLY INVASIVE DENTISTRY: TIPS AND TRICKS TO MAXIMIZE SUCCESS

Predictable apical microsurgery (Part I)

Author_John J. Stropko, DDS

c.e. credit

This article qualifies for C.E. credit. To take the C.E. quiz, log on to *www.dtstudyclub.com*.

_Surgery will never replace solid endodontic principles and should always be a last resort. Apical microsurgery consists of nine basic steps that must be completely performed in their proper order so we can achieve the desired result for our efforts.

The nine steps are as follows:

1. Instruments, supplies and equipment are ready.

2. Patient, doctor and assistants positioned ergonomically.

3. Anesthetic and hemostasis staging completed.

4. Incision and atraumatic flap elevation.

5. Atraumatic tissue retraction.

6. Access, root-end bevel (root-end resection, RER, and REB) and crypt management.

7. Root-end procedures: root-end preparation (REP).

8. Root-end fill (REF) techniques and materials.

9. Sutures, healing and post-op care.

Predictable microsurgery requires the use of an operating microscope (OM) and a team committed

to operating at the highest level. The six-handed team approach optimizes the instruments, equipment, techniques and materials that today's level of technology presents for the benefit of all — especially the patient!

Dr. Berman, an old retired general surgeon, and one of my senior-year dental school instructors, would begin each general surgery lecture by tapping the lectern with his pencil, and after getting our attention, he would say, "Treat the tissues with tender loving kindness and they will respond in a like manner." I have heard those very words many times while performing apical microsurgery. It is truly a gentle technique when the steps are followed in the proper order.

_Preparation of the patient

A thorough past medical history and dental examination, using as many diagnostic aids as possible, is a requirement for a predictable microsurgical event. Being thorough can also avoid un-

Fig. 1_The six-handed team approach enables us to maximize today's technology today. (Photos provided by Dr. John Stropko) Fig. 2_The six-handed team creates an environment for ergonomics and the most efficient use of time.

favorable experiences. For example, if the patient, or the physician, states he or she is sensitive or allergic to epinephrine, to any degree, the author highly recommends that apical microsurgery not be performed. One of my golden rules of thumb is, "No epi, no surgery ... Period!" If the doctor chooses to proceed with the microsurgical procedure, it will be exceptionally more difficult for both the doctor and the patient.

The technology that exists today presents us with so much more presurgical information than was available even a few years ago, and the recent advances should be included in the diagnostic process whenever possible. A good example of current technology is cone-beam computed tomography (CBCT). The radiological images we have been using for many years were the best we had, but were very limited. Now, CBCT enables the microsurgeon a view of all angles of areas of concern in the maxillofacial region and supplies much of what was missing in the field of dentistry.¹

The preparation of the patient not only takes the patient into consideration, but also the entire surgical team. The microsurgical protocol we teach involves four people: the doctor (pilot), the scope assistant with the co-observer oculars for evacuation and retraction (co-pilot), the surgical assistant using the monitor as a visual reference (flight director) and the patient (first-class passenger).

The medical history and all necessary premedications are reviewed with the patient to be sure that the latter are taken at the appropriate times before the surgery appointment. The patient is also instructed to rinse with Peridex and take an anti-inflammatory (preferably 600 mg of Motrin, if no allergies are present) the night before and also on the morning of the surgery. At the time of the appointment and before the patient is seated, he or she is once again asked to rinse with Peridex. The dental chair should allow the patient to recline comfortably and even allow the patient to turn to one side or another. Small Tempur pillows placed beneath the patient's neck, small of the back or knees make a big difference when used.

After the patient is completely comfortable in the chair, he or she is coached on how to make slow and small movements of the head, if necessary during surgery. The patient is appropriately draped for the surgery. It is especially important to wrap a sterile surgical towel around the head and over the patient's eyes for protection from the bright light of the microscope and any debris from the surgical procedure.

An important psychological point is being sure to not tell the patient he or she "can't move"! To an already tense patient, saying "don't move" would probably cause unnecessary apprehension, stress or panic. In more than 500 surgeries, I've only had one patient who didn't hold nice and still during the procedure once he was relaxed and had profound anesthesia.

Now is the time for the surgical team to get comfortable with the position of the patient, the microscope, endoscope and associated equipment. Modern OMs have many features to enhance comfort and proficiency during their use. Accessories like beam splitters, inclinable optics, extenders, power focus and zoom, variable lighting and focal length, etc., all contribute to ease of use, ergonomics and proficiency for the entire surgical team. The mutual comfort of the patient, the surgical assistants and the doctor is of the utmost importance. The microsurgical technique may take an hour or more, so unnecessary movements or adjustments for comfort's sake during the operation may cause considerable inconvenience.

The doctor's surgical stool must have adjustable arms to allow the elbows to support the back and serve as a reference point, or fulcrum, if the doctor has to reach for an instrument during **Fig. 3_**Smaller straight Tempur pillow can be used for the neck, lower back or knees to give added support for patient comfort.

Fig. 4_Patient's head and chest are draped and the patient's vital signs are constantly monitored using a Pulsoximeter.
