Start 2017 in Boston

Yankee Dental Congress includes three-day exhibit hall, lots of C.E.

The exhibit hall at the 2017 Yankee Dental Congress, expecting to host more than 450 companies and organizations, will include a variety of education pavilions, more than 30 free C.E. courses and daily special events.

Nearly 28,000 dental professionals are expected at New England's largest dental meeting from Jan. 25–29, at the Boston Convention and Exhibition Center. The exhibit hall will be open from Jan. 26–28.

Thanks to sponsors, the C.E. courses on the exhibit floor are free (but do require registration). The selection of C.E. courses include: "Oral Malignancies and Mimics," Marketing Strategies That Work in 2017; "Medical Billing for Dentists," "Motivational Interviewing: Achieving Sustainable Health Behavior Change," "Dental Pulp Cells: From Basic Biology to Regenerative Medicine," "How to Get Google, Yelp and Facebook Reviews," "HIPAA Help for Dental Practices" and "Polish Your Payroll

for a More Efficient Practice."

The exhibit hall portion of the congress is scheduled to open at 9:30 a.m. on Thursday, Jan. 26, and the hall will close for the day following a welcome reception from 4-5:30 p.m. featuring beer and popcorn. Another end-of-the-day reception on Friday will feature complimentary beer, specialty drinks and hors d'oeuvres during the day's final 90 minutes of socializing, browsing, researching and shopping on the exhibit hall floor.

At noon on Saturday in the food court, attendees will be able to sample award-winning chowder from Levy Restaurants, Seaport Hotel, Hyatt Regency Boston, Revere Hotel Boston Common and Starwood of Boston at the Yankee Dental Congress 17th Annual Chowder Tasting.

On all three days of the exhibit hall, "mystery shoppers" will randomly be re-

Industry loses pioneer dental hygiene educator

Esther Wilkins, RDH, DMD, a Tufts University graduate and clinical professor of periodontology emerita, died on Dec. 12 at her home in Hudson, N.H. She had just turned 100.

Wilkins was a renowned authority on dental hygiene, and she had a profound influence on dental medicine for more than half a century. She was a member of the faculty of the department of periodontology at Tufts for 45 years and conducted more than 800 continuing education classes. She was the recipient of a number of important awards, including the prestigious Gies Award for Achievement by a Dental Educator in 2012.

It was her enthusiasm for her work and her drive to educate thoroughly as many people as she could about the power of prevention that made her "a shining star in dental and allied dental education," said Richard W. Valachovic, president of the

American Dental Education Association's Gies Foundation. Wilkins wrote what has become the cornerstone text in almost every dental hygiene education program in the United States and around the world, "Clinical Practice of the Dental Hygienist," now in its 12th edition. Generations of dental professionals have been educated or influenced by her.

In 2008, she established the Dr. James B. Gallagher Jr. and Dr. Esther M. Wilkins Scholarship Fund, which has supported many Tufts dental students. She met Gallagher, her husband, while both were pursuing a postgraduate certificate in periodontology at Tufts. He passed away in 1988.

Wilkins was slated to receive the School of Dental Medicine's Dean's Medal, which recognizes individuals who have demonstrated loyalty, service and generosity, along with her classmate Hilde Tillman, Tufts clinical professor emerita of public health

Glass ionomer restorative is fast-setting, immediately packable

**YDC
BOOTH
NO. 1231**

By VOCO Staff

IonoStar Plus is a new glass ionomer restorative from VOCO that offers a fast set, immediate packability, non-stick handling and enhanced physical properties, according to the company.

Designed to reduce or remove many of the headaches associated with glass ionomer restoratives, IonoStar Plus comes in a direct-activation application capsule that fits virtually all branded glass ionomer applicators. Once triturated and placed in the mouth, IonoStar Plus

offers two stages of consistency that first provide ideal “wetability” for marginal adaptability, and then immediate packability to enable shaping and sculpting without any pull-back, the company asserts.

IonoStar Plus has an abbreviated working time of two minutes that enables the clinical procedure to proceed quickly when time is an important factor. IonoStar Plus is radiopaque, fluorescent, has a high continuous fluoride release and does not require the use of a dentin conditioner.

For more information on IonoStar Plus you can visit the VOCO website at www.vocoamerica.com.

An expert's opinion

Tilting mechanism expands usability of small implant attachment

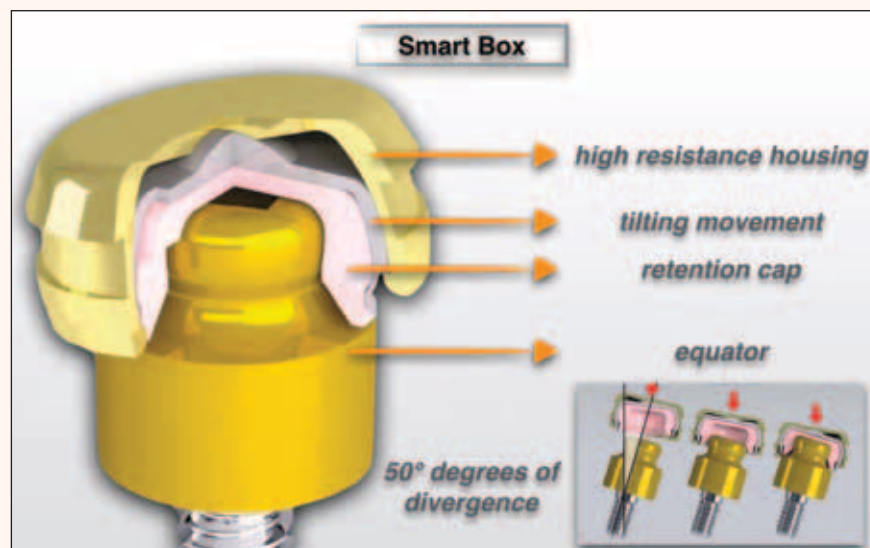

DR. ROBERTO SCRASCIA is a dentist master in bone regenerative surgery and a prosthodontist. He is the author of numerous publications in Italy and internationally. He can be contacted at Roberto.scrascia@gmail.com.

By Dr. Roberto Scrascia

In the implant prosthetic rehabilitation with an overdenture, the choice of the retentive systems is a crucial moment; it is fundamental to carefully analyze and evaluate the options pro-

vided by the market in order to avoid problems that may occur at an early stage or during the treatment.

Before the Smart Box (Rhein83, Italy), there was little chance to use the good performances of the OT Equator when severe divergences of the implants is required because of the amount of

The Smart Box inner-tilting mechanism enables clinicians to use the OT Equator's small-size benefits even with patients with jaw bone loss. Rhein83 manufactures both products and describes the OT Equator as 'the smallest implant attachment on the market.'

available bone after resorption in elderly patients' jaws.

In situations like these, a low-profile attachment is often the preferable solution, because it provides a good stability and all the space for an esthetic denture.

Thanks to this innovative and original mechanism, we can extend the limit of usability of the OT Equator attachment without losing any of its performances and its qualities. The Smart Box with the tilting mechanism enables and facilitates the smooth insertion of the prosthesis, a positive feature of the OT Equator.

Smart Box is a new product that provides us a good opportunity to enhance the solutions to be proposed to the patient in our everyday work.

Learn more about Rhein83

The Smart Box is from Rhein83, which has specialized in dental-attachment production for more than 30 years.

Rhein83 created the Smart Box to be used with its OT Equator, which the company describes as the smallest implant attachment on the market, in cases of extreme divergencies between the implants.

An inner tilting mechanism enables a passive insertion with divergent implants up to 50 degrees.

For more information you can visit www.rhein83.com or email the company at marketing@rhein83.it.

To learn more about Rhein83 in the United States, contact the company at info@rhein83usa.it or (877) 778-8383.

You can visit the company online at www.rhein83usa.com to learn more about all of its products and services.

Anesthesia-free and drill-free deep decay removal

By Dr. Robert Feudo

YDC
BOOTH
NO. 2017

Applications and research on lasers in dentistry continue to expand, yet the Solea® dental laser (Convergent Dental) is the first and currently the only laser system that can cut any tissue with a single setting. The one-setting-fits-all approach works for tooth structure, bone and soft tissue, enabling any dentist to reliably deliver anesthesia-free, blood-free, suture-free and pain-free results.

The following case shows just how safely and easily caries disease, specifically a deep-decay situation, can be removed by dentists using Solea — and the esthetically pleasing results that follow. Solea's revolutionary software is so easy to use that any dentist can become a laser dentist while providing the patient a more pleasant experience.

Case presentation

The patient presented with recurrent subgingival buccal decay on tooth #18 and #19 (B) (Fig. 1). The clinical objective was to completely remove the caries and then restore the teeth. The total procedure was completed in approximately 10 minutes and did not require any injectable anesthetic.

For the first step of the procedure, the enamel needed to be cut to access the de-

DR. ROBERT FEUDO maintains a state-of-the-art dental facility on the North Shore of Boston in Danvers, Mass. He holds a BS in biology from Suffolk University and received his DMD from the Tufts School of Dental Medicine. Feudo is a member of the American Dental Association and the Massachusetts Dental Association.

cay. This procedure was performed using the "Hard and Soft Tissue" setting and was adjusted to 100 percent mist to effectively penetrate the enamel. For soft tissue, a reduced mist setting would be applied for appropriate coagulation.

To prepare the enamel as well as the patient, it's recommended to outline the prep at approximately 10–20 percent power and observe the patient and the analgesic effect. Simply apply pressure to the foot pedal to increase or lessen the laser power.

Once the enamel was outlined, a 1.25 mm spot size was chosen and a cutting speed of between 40–60 percent was used to smoothly and gently break through the enamel. With Solea, the learning curve is minimal; maneuvering the handpiece back and forth is all it takes for a clean and efficient cut.

Once the proper amount of enamel was removed, I then removed some soft tissue as well to better access the subgingival decay. I used a 1.00 mm spot size setting and

40–50 percent cutting speed along with 100 percent water mist. I did not need to adjust the water and usually don't unless the area is extremely inflamed.

The dentin was now exposed, and I was ready to eliminate the deep decay (Fig. 2). For the decay removal in the dentin, the same 1.00 mm spot size was chosen with a cutting speed between 30–40 percent. The decay was then thoroughly and easily removed using the laser by applying a gentle gliding back-and-forth motion of the handpiece. Both teeth were then ready for restorative work using only the Solea and a spoon excavator.

The teeth were then restored using Ultra-Etch® (Ultradent), Adhese® Universal (Ivoclar Vivadent) and Filtek™ Supreme Ultra Universal Restorative A3B (3m). The total procedure, from start to finish, was a mere 10 minutes (Fig. 3).

Benefits of Solea

Solea has drastically changed the way I

practice dentistry. This is just one of many cases that I've completed using this truly revolutionary laser. Using Solea has provided my practice substantial surges in production and workflow efficiency, and, moreover, patient compliance has dramatically increased.

Procedure time was reduced from typically 40 minutes compared with a mere 10 minutes with Solea to complete the case. Productivity was increased in several ways. Because the patient did not require any anesthetic, a significant amount of time was saved. If I were to use traditional instrumentation, there would have been at least one injection given and then time spent waiting for anesthetic to set in. In addition, the occlusion was accurately checked with the patient at the completion time of the procedure — potentially avoiding a follow-up appointment for a bite adjustment. Eliminating the anesthetic process also allows the ability to perform multi-quadrant dentistry in the same appointment.

Orlando will be the site of the Academy of Osseointegration 2017 Annual Meeting. Photo/Provided by Visit Orlando, www.visitorlando.com

Multidisciplinary meeting with AAOMS, AAP and ACP will feature 'new insights and better ideas'

By AO Staff

Registration is now open for the 2017 Annual Meeting of the Academy of Osseointegration (AO). The meeting is being held March 15-18 in Orlando, Fla., and will be a collaboration with the American Association of Oral and Maxillofacial Surgeons (AAOMS), the American Academy of Periodontology (AAP) and the American College of Prosthodontists (ACP). This year's meeting theme is "Good to Great: Making Excellence a Clinical Reality."

Non-members can join AO now to take advantage of all of the benefits of membership, including a significant savings on registration fees. Register by Feb. 27 to take advantage of the advance registration discount.

"There will be an outstanding collection of speakers, from around the world, presenting throughout the meeting," said Dr. Jeffrey Ganeles, 2017 Planning Committee chair. "The committee went out of its way to blend classic powerhouse speakers with emerging talent, to address dozens of important, clinically relevant topics in implant dentistry. Our goal is to provide AO meeting participants with new insights

and better ideas, which they can take back to their practices on Monday morning."

Registration fees for the annual meeting include:

- Most scientific sessions (including TEAM Program and Laboratory Technician programs)
- Admission to the corporate forums and exhibit hall
- Thursday's welcome reception
- Friday's president reception
- Continental breakfasts
- Complimentary lunches and ePosters in the exhibit hall

The opening session is going to address the meeting theme very closely, relative to what clinicians do now vs. 20 years ago. Dr. Jill Helms DDS, PhD, from Stanford University, will present "Beauty, Reconsidered."

The meeting will also feature an innovative session on "The Business of Implant Dentistry." Moderated by Bill Ryan, it will look at various practice delivery systems.

Dr. Ole Jensen will be moderating a session highlighting developments that have occurred since the AO Sinus Consensus Conference. This session will feature Alan Herford, Craig Misch, Paul Fugazzotto and Eric Dierks.

The closing session will focus on the

"team approach" to the treatment of various clinical problems. Several international teams will be presenting.

The regional focus in 2017 will be Latin America. Latin American speakers are included throughout the 2017 program to give meeting attendees a unique insight into the practice of implant dentistry in this region. Simultaneous translation in Spanish and Portuguese will be offered for the sessions held in the main meeting rooms.

Follow AO on Facebook, Twitter and LinkedIn using #AOOrlando to stay up-to-date on the event news. For registration, program and travel details, visit <http://meetings.osseo.org/>.

About the Academy of Osseointegration

With 6,000 members in 70 countries around the world, the AO is recognized as a premier international association for professionals interested in implant dentistry. AO serves as a nexus where specialists and generalists can come together to evaluate emerging research, technology and techniques; share the best information; and coordinate optimal patient care using timely, evidence-based science and methods.

Dr. Carl Misch

Industry loses implant pioneer

By Sierra Rendon, Implant Tribune

Dr. Carl Misch, co-founder of BioHorizons and founder of the Misch Institute, passed away on Jan. 3.

Misch was a renowned American prosthodontist and was recognized internationally for his clinical and academic contributions to the field of implant dentistry.

Misch maintained a private practice restricted to implant surgery (bone grafting and implant placement) and related prosthetics for more than 30 years. He previously practiced in Beverly Hills, Mich.

One of his colleagues, general dentist Gregori Kurtzman, tells this story of Misch:

"Years ago, I had to introduce him at an ICOI (International Congress of Oral Implantologists) meeting at the main podium. We had known each other for a number of years, and I called him to ask what he wanted me to say in the intro," Kurtzman recalled. "He tells me once he had 45 minutes to speak and the guy introducing him read his entire CV, which took 20 minutes, leaving Carl with only half the allotted time.

"So I get up at the podium and say, 'Our next speaker is an unknown, but we figured we would give him a shot at speaking, so let me introduce Carl Misch.' It did get some laughs."

In 1973, Misch graduated magna cum laude from the University of Detroit Dental School. He received
