EDITOR'S MESSAGE

We are proud to present to you the inaugural *Dental Tribune ASEAN Edition!*

The world's dental newspaper is now in Malaysia, sharing with you the latest news on dentistry which covers various topics from region to world news, event updates, innovations, research, and clinical section.

Dental Tribune International (DTI), based in Leipzig, Germany, has been in the dental publishing business since 2003 and has grown substantially over the last ten years. Today, the DTI publishing group is composed of the world's leading dental trade publishers and this partnership with FBI Publications (M) Sdn Bhd is expected to flourish!

Our international team of journalists and writers will bring you the latest news in the industry to deliver you worthwhile and compelling articles and interviews to ensure you are always up to date.

Making its debut in Malaysia, our news will provide you exclusive insights and content into the dentistry world.

Susan Tricia
Editor

DT ASEAN will also be circulated in dental exhibitions, seminars and even webinars in Malaysia providing additional mileage for advertisers of the magazine and reaching out to new subscribers.

So go ahead and indulge in this edition and keep the feedback coming in to ensure our writers are providing you with a quality read always!

– CS 12460 VELVET –

LOVE YOUR GUMS

GOLD
STANDARD
FOR GENTLE
CLEANING

WONDERFULLY GENTLE – MORE THAN TWICE AS MANY BRISTLES AS OUR HIGHLY SUCCESSFUL CS 5460 ULTRA SOFT TOOTHBRUSH: AN UNMATCHED 12,460 CUREN® FILAMENTS, EACH WITH A DIAMETER OF 0.08 MM.

1. Toothbrushes are too hard.

At first, the damage caused by brushing is microscopic. Over the years, however, it can lead to abrasions, recession and pain. The CS 12460 velvet helps to prevent these symptoms.

2. We often brush our teeth in a hurry.

The CS 12460 velvet turns brushing into a ritual that people enjoy taking their time over, not least thanks to how gentle the brush is.

Made in Switzerland.

Planmeca Viso™ imaging Powered by Romexis® software

Romexis 6.0 makes your work flow

Our revolutionary Planmeca Romexis® software provides an all-in-one solution for all specialities and for clinics of all sizes. As an open software platform, Romexis allows capturing, viewing and processing all types of data – also from 3rd party devices – in the same system. With Romexis, you have the freedom to choose your own ways of working.

Live virtual FOV positioning

See the patient live from the unit's control panel for flexible and exact FOV positioning

Planmeca CALM™

Our new patient movement correction algorithm – for perfect results every time

Planmeca Ultra Low Dose™

Enables CBCT imaging with an even lower dose than panoramic imaging

Freely adjustable volume

Adjustable volume sizes to cover all clinical needs – from the smallest to largest FOVs

Planmeca Viso G7 Ø3x3 to Ø30x30 cm
Planmeca Viso G5 Ø3x3 to Ø20x17 cm

Planmeca ARA™

Efficiently removes shadows and streaks caused by metal from 3D images

Planmeca AINO™

Removes noise from CBCT images without losing valuable details

YEARS OF LEADING THE WAY

The use of new technologies and digital implant solutions in a one-stage surgical procedure

By Dr Michał Nawrocki, Poland

The aim of this article is to present a case of single-tooth prosthetic restoration in the aesthetic zone step by step. The patient was referred to our clinic with a fractured root of tooth #11 (Fig. 1). The cone beam computed tomography (CBCT) analysis confirmed the fracture and revealed external resorption of the root from the vestibular side (Fig. 2). The tooth had to be extracted, and it was decided to follow immediate implant placement with a temporary aesthetic implant restoration. The immediate implant placement was planned with short-term non-occlusal loading.

Fig. 1: Situation before treatment, which led to the decision to extract tooth #11

With the use of the CEREC Omnicam scanner (Dentsply Sirona), scans were taken of both the maxillary and the mandibular full arches along with a buccal scan (Fig. 3). The scans, together with the DICOM files, were uploaded to the Simplant software (Dentsply Sirona; Figs. 4 & 5).

The optimal position was planned for an Ankylos C/X B 14 implant (Dentsply Sirona) in line with the 3A–2B rule.¹ Using the Simplant software, a Simplant Guide, along with a patient-specific Atlantis CustomBase Solution (with a titanium nitride abutment surface; Dentsply Sirona) and digital files, were ordered using Atlantis Core File (Dentsply Sirona).

Fig. 2: CBCT scan: the root of the tooth was visibly fractured, and there was clear external resorption of the root from the vestibular side.

Fig. 3: Buccal scan: information on the positioning of the maxilla relative to the mandible. This is absolutely necessary for designing a crown.

Fig. 4: Designing the guide in the Simplant software based on the planned implant position.

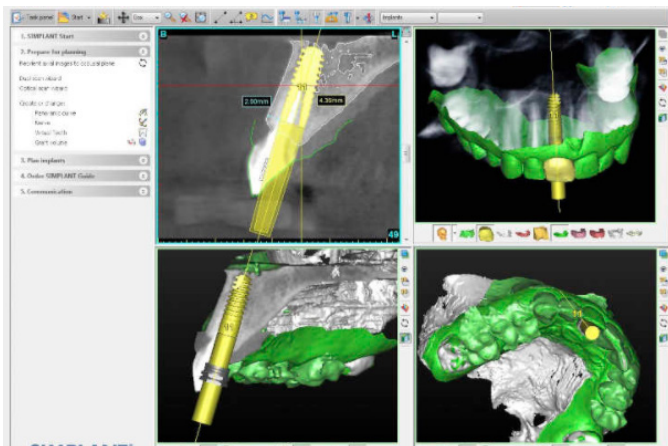

Fig. 5: Overlaying the CBCT and CEREC intra-oral scans, as well as the planned implant position, in the Simplant software.

The digital files were used to design and manufacture a screw-retained Atlantis crown for implant #11 in the CEREC CAD/CAM system (Dentsply Sirona). All the components, the Simplant Guide, the Atlantis abutment and the temporary crown, using CEREC, were manufactured and delivered prior to the surgical procedure (Figs. 6–8).

Fig. 6: Planning the shape and size of the future CAD/CAM full ceramic crown in cut-back technique in the inLab software (Dentsply Sirona) based on the Atlantis Core Fire received.

After precise planning, the tooth was extracted. At the resorption and fracture area of tooth #11, granulation tissue was clearly visible (Fig. 9). The granulation tissue was removed with an Er:YAG laser (H14 handpiece, Fotona; Fig. 10). The extraction was atraumatic and the socket clean and ready for implant placement (Fig. 11).

Fig. 7: Full ceramic crown milled in the CEREC CAD/CAM system before sintering. As can be seen in the images, the Atlantis Abutment and the crown would fit perfectly together.

Fig. 8: The completed screw-retained IPS e.max crown ready to be cemented extra-orally with the Atlantis abutment (titanium nitride abutment surface).

Fig. 9: Visible granulation tissues at the resorption and fracture area of tooth #11.
